Hiring Manager
NAVER Corporation

Dear Hiring Manager,

I am applying for the Software Engineer / AI Engineer position at NAVER. I am completing a Bachelor's degree in Computer Engineering at Gachon University (GPA 4.42/4.5), and alongside my studies I have built real production software and worked hands-on with machine learning. That mix — shipping engineering work and computer vision experience — is what I would bring to your team.

During a machine learning internship, I built and curated computer vision datasets for detection tasks including person, vehicle, face, fire, smoke, violence, and fall detection. I developed automated annotation and preprocessing pipelines using YOLO, SAM, and Qwen-VL together with custom tooling, which improved data quality, class balance, and labeling efficiency. I also helped train and evaluate the models themselves, so I understand the full lifecycle from raw data to a working model.

Before the internship, I worked as a full-stack developer building enterprise software for real business operations. In that role I:

- designed and developed ERP and CRM platforms that automated complex business processes;
- built backend services with PHP, Yii2, FastAPI, MySQL, and SQLAlchemy;
- developed REST APIs and real-time features using WebSockets;
- improved database performance through query tuning, caching, and architecture changes; and
- worked closely with stakeholders across teams to deliver reliable, maintainable software.

NAVER is the company I most want to work for because of how it puts AI directly into services that millions of people use every day. I follow the work around HyperCLOVA X and NAVER's approach of building AI into core products such as search and shopping rather than treating it as a separate feature. My computer vision background and my experience building and scaling backend systems feel like a natural fit for that kind of large-scale, AI-driven product work, and I am eager to keep learning alongside the engineers doing it.

I would welcome the chance to discuss how my engineering experience and hands-on machine learning work could contribute to your team. Thank you for your time and consideration.

Sincerely,
Yusufjon Akhmedov
